ABSTRACT

This report presents detailed tabulations of data from the Current Population Survey on school enrollment in October 1986, and summary time series of data collected since the inception of the survey in 1946. School enrollment data are shown by the following personal and school characteristics: (1) age; (2) race; (3) Hispanic origin; (4) sex; (5) marital status; (6) family income; (7) educational attainment of householder; (8) metropolitan residency; (9) level and grade of school; (10) full-time attendance status; (11) public/private school; and (12) two-year/four-year college. Among the highlights of the data presented are the following: (1) in October 1986, there were 60.1 million persons enrolled in school, including 12.4 million college students and 6.5 million children enrolled in pre-primary school; (2) no level of school demonstrated a significant change in enrollment from 1985 to 1986; (3) between 1981 and 1986, pre-primary enrollment grew by one-fourth; (4) in the same period, elementary and high school enrollment declined by about 3 percent; (5) total college enrollment was not different in 1986 from any year since 1981, even though the traditional college-age population has declined; and (6) Black elementary school enrollment decreased less than White enrollment since the peak enrollment year, 1970--the Black elementary school-age population will increase proportionately more than the comparable White population during the next decade. Data are presented on 41 tables and figures. Appendices present supplementary tables, provide definitions and explanations, and discuss the source and reliability of the estimates. (BJV)

Acknowledgments

This report was prepared in the Education and Social Stratification Branch, under the general direction of **Paul M. Siegel**, Chief. **Brenda R. Jeffries** contributed to table preparation, and **Andrea E. Adams** conducted the statistical review of the text. Survey operations and data processing were coordinated by **Kathleen P. Creighton**, Demographic Surveys Division. Sampling review and appendix C were provided by **Lloyd Hicks**, Statistical Methods Division. **Robert Kominski**, Education and Social Stratification Branch and **Signe Wetrogen**, Population Projections Branch, Population Division, reviewed the contents of the report. Overall direction was provided by **Arthur J. Norton**, Assistant Chief, Population Division. Data collection was conducted by Bureau of the Census interviewers under the overall direction of **Stanley D. Matchett**, Chief, Field Division.

The staff of Publication Services Division, **Walter C. Odom**, Chief, performed publication planning, design, composition, editorial review, and printing planning and procurement. **Linda H. Ambill** performed publication coordination and editing.

DETAILED TABLES

1. Enrollment status for persons 3 to 34 years old, by age, sex, race, Hispanic origin, and Mexican origin: October 1986 5
2. Enrollment status for persons 3 to 34 years old by residence, age, race, Hispanic origin, and Mexican origin: October 1986 9
3. Level of enrollment for persons 3 to 34 years old by control of school, residence, sex, race, Hispanic origin, and Mexican origin: October 1986 14
4. Level of enrollment for persons 3 years old and over, by age and sex: October 1986 18
5. Attendance status for nursery school and kindergarten students 3 to 6 years old by level and control of school, residence, age, race, and Hispanic origin: October 1986 19
6. Attendance status for college students 16 to 34 years old by sex, age, residence, year and control of college, race, and Hispanic origin: October 1986 21
7. Enrollment status in 1985 for persons 14 to 24 years old by educational attainment, age, sex, race, and Hispanic origin: October 1986 23
8. Year of high school graduation for persons 16 to 34 years old by educational attainment, enrollment status, sex, and race: October 1986 27
9. Enrollment rates for persons 3 to 34 years old by age, race, Hispanic origin, and region: October 1986 31
10. Marital status for persons 14 to 34 years old by level and status of enrollment, attendance status, age, sex, and race: October 1986 32
11. Enrollment status of primary family members 3 to 34 years old by educational attainment of family householder, level and control of school, sex, race, and Hispanic origin: October 1986 35

12. College attendance of primary family members 18 to 24 years old, by family income, race, and Hispanic origin: October 1986 42
13. Enrollment status for primary family members 18 to 24 years old by family income, control of school, marital status, sex, race, and Hispanic origin: October 1986 44
14. Enrollment status for primary family members 3 to 17 years old by family income, level and control of school, sex, race, and Hispanic origin: October 1986 49
15. Single grade of enrollment and high school graduation status for persons 3 to 34 years old by age, sex, race, and Hispanic origin: October 1986 54
16. Modal grade of enrollment for persons 3 to 21 years old by race, sex, age, and Hispanic origin: October 1986 60
17. Persons 35 years old and over by enrollment and attendance status, labor force status, marital status, sex, and race: October 1986 63
18. Enrollment of college undergraduates 14 to 34 years old by type of college, residence, age, and sex: October 1986 64
19. Attendance status of college undergraduates 16 to 34 years old by sex, age, type, year, and control of college, and residence: October 1986 65
20. Year of high school graduation for college undergraduates 16 to 34 years old by type and year of college and sex: October 1986 67
21. Enrollment status in 1985 for college undergraduates 14 to 24 years old by type of college, educational attainment, age, and sex: October 1986 68
22. College undergraduates 14 to 34 years old by region and type of college: October 1986 69
23. Marital status of college undergraduates 14 to 34 years old by type of college, attendance status, age, and sex: October 1986 70
24. Undergraduate attendance status of primary family members 14 to 34 years old by educational attainment of family householder and type and control of college: October 1986 71
25. Undergraduate enrollment status for primary family members 18 to 24 years old by family income, marital status, type and control of college, and sex: October 1986 72

School Enrollment—Social and Economic Characteristics of Students: October 1986

INTRODUCTION

This report presents detailed tabulations of data on school enrollment in October 1986 and summary time series of data collected since the inception of the survey. The data are from the October school enrollment supplement to the Current Population Survey (CPS). Data on school enrollment of the civilian noninstitutional population have been collected in the CPS annually since 1946 and regularly reported in this publication series. School enrollment data are shown by the following person and school characteristics: age, race, Hispanic origin, sex, marital status, family income, education of householder, metropolitan residence, level and grade of school, full-time attendance status, public/private school, and two-year/four-year college.

HIGHLIGHTS

Some of the highlights of the data presented are:

- In October 1986, there were 60.1 million persons (±0.5)[1] enrolled in school.
- No level of school shown in this report demonstrated a significant change in enrollment from 1985 to 1986.
- Over 5 years (1981-1986) preprimary enrollment grew by one-fourth (24.8 percent ±4.7)
- In the same period, elementary and high school enrollment declined by about 3 percent (±1.1).
- Total college enrollment was not different in 1986 from any year since 1981, even though the traditional college-age population has declined.
- Black elementary school enrollment decreased less than White enrollment since the peak elementary enrollment year, 1970. The Black elementary school-age population will increase proportionately more than the comparable White population during the next decade.

In 1986, there were 60.1 million persons enrolled in school, including 12.4 million college students and 6.5 million children enrolled in preprimary school. There were no changes in enrollment since 1985 at any level shown in table A. Between 1981 and 1986, preprimary enrollment increased by about one-fourth and elementary school and high school enrollment declined, while college did not change significantly.

TRENDS IN ELEMENTARY AND HIGH SCHOOL ENROLLMENT

Increased population and an increased enrollment rate contributed to a significant rise in preprimary enrollment from 1981 to 1986. Annual variations in elementary school enrollment have been nearly exclusively determined by demographics—changes in the numbers of births in previous years and to a lesser extent, immigration and mortality. At the elementary level, although larger cohorts have entered lower grades, they have not yet affected the total figures for elementary school because enrollment in the upper grades has declined. By 1986, the first through third grades exhibited significant gains in enrollment, from their lowest levels in the early 1980's. The larger cohorts will begin to affect high school enrollment figures in the early 1990's.

Table A. School Enrollment of Persons 3 Years Old and Over by Level: October 1986, 1985, and 1981

(In thousands)

Level	1986	1985	1981
Total[1]	60,062	59,780	59,858
Nursery school	2,553	2,491	*2,058
Kindergarten	3,961	3,815	*3,161
Elementary school	27,121	26,866	*27,795
High school[1]	14,025	14,084	*14,717
College[1]	12,402	12,524	12,127

*Significantly different from the figure for 1986, at the 90 percent level of confidence.

[1] Includes persons 35 years old and over, not shown in most detailed tables.

The picture was slightly different for separate race and ethnic groups. Although for Whites there has not been a significant increase in elementary enrollment, the number of Black and Hispanic students in elementary school in 1986 was significantly above the figure two years earlier[2] (table A-2).

---

[1] The data in this report are from a sample of the population and, therefore, are subject to both nonsampling and sampling error. The number in parentheses is equal to 1.6 times the standard error of the estimate. This gives the 90-percent confidence interval when added to and subtracted from the estimate. A complete discussion of confidence intervals and standard errors is in appendix C.

The population changes which have influenced elementary school enrollments over time have been different for Whites and Blacks. Since 1970, the year of the highest elementary school enrollment, the proportional decline in Black elementary school enrollment was smaller than that for Whites because the proportional population decline was less for Blacks than for Whites (figure 1). Both groups experienced decreases in birth rates, but the rate for Blacks remained higher than that for Whites. From 1970 to 1986, White elementary school enrollment declined by 24 percent and Black enrollment declined by 11 percent. Different trends are projected for the future size of each group. Because of likely continued higher fertility rates among Blacks, the increase in the elementary school-age population will be proportionately greater for Blacks than for Whites. According to latest population projections, from 1986 to 1998 (projected to be the next peak year for the elementary school age population), the White population 6 to 13 years old will rise by 14 percent but the Black population will increase by 24 percent.[3] By 1998, when the elementary school-age population reaches a new peak of 31 million, there will be a new all-time-high number of Black elementary school-age children. The size of the Black population 6 to 13 years old will be about 15 percent larger than in the last peak year, 1970. For Whites, the new peak will be about 12 percent lower than the 1970 figure. Even with the greater proportional increase among Blacks than Whites, Blacks will increase only slightly as a proportion of the total population in the age group, from 15.6 in 1986 to 16.7 in 1998 (they were 13.6 percent in 1970).

TRENDS IN COLLEGE ENROLLMENT

Demographic changes have had a significant influence on college enrollment also: beginning in the late 1960's, increases in the young college age population, brought about by the maturing of the baby boom cohort, contributed substantially to the increased college student population. As that cohort (born 1947 to 1961) began to move out of the traditional college ages, to be replaced by smaller cohorts, it was popularly expected that college enrollment would decrease. It has not happened.

The total number of college students in 1986 was not significantly different from that in any year since 1981 (table A-4). This stability can be attributed, in part, to the increased enrollment of older students (25 years old and over) who increased by 11 percent from 1981 to 1986, which resulted primarily from the increase in the older population. The number of younger students enrolled did not change significantly, because enrollment rates increased concurrently with the population decline. Since 1981, the 18- to 24-year-old population declined by about 2.5 million persons, but the number of college students of that age did not change significantly. The proportion of the age group enrolled in college rose 2 percentage points, to 28 percent, from 1981 to 1986. Even in the youngest age group, 18- and 19-year-olds, whose population declined by about 13 percent since 1981, the number enrolled in 1986 was not different from that in any year since 1975.

The college enrollment rate of high school graduates did not change significantly in the decade preceding the survey. Table A-5 shows that the proportion of 18- to 24-year-old high school graduates enrolled in college (34 percent) was not significantly different from the proportion enrolled in 1976. For Blacks, on the other hand, the proportion declined to 28.6 percent in 1986, from 33.5 percent 10 years earlier. Much of the decrease for Blacks can be attributed to the increase in the proportion of youths completing high school but not a concurrent rise in the proportion of the age group attending college.

The picture of undergraduate college enrollment in the 1980's contradicts the traditional concept of full-time enrollment in a four-year college. Only half of all undergraduates were attending four-year colleges full time in 1986 (table B). A little more than one-third of undergraduates were enrolled in two-year colleges (split about evenly between full time and part time) and about one-eighth were enrolled in four-year colleges part time.

Larger shares of Hispanics than Whites or Blacks attended two-year colleges and attended part time in 1986 (table B). About 45 percent of Hispanic undergraduates, compared with 36 percent of Whites and 31 percent of Blacks, attended two-year colleges. The proportions attending part time were 41, 33, and 29 percent, respectively. Among young undergraduates (under 25 years old), 62 percent of Whites and 65 percent of Blacks (not significantly different from each other) but only 45 percent of Hispanics were full-time students in four-year institutions.

Twice the proportion of White students as Blacks were reported to be graduate students (20 percent vs.

---

[2] Beginning in 1985, estimates were based on revised survey weighting procedures which included separate population controls for persons of Hispanic origin. The new technique increased the Hispanic population counted in the survey and consequently increased reported Hispanic enrollment. Any change in Hispanic figures from 1984 to 1985 which were not also evident for other groups must be viewed with caution because of the change in weighting procedures.

[3] U.S. Bureau of the Census, Current Population Reports, Series P-25, No 952, *Population Projections by Age, Race, and Sex: 1983 to 2020.*"

11 percent) in 1986. Blacks were 12 percent of undergradutes, but only 6 percent of all graduate students. Among graduate students, Whites and Blacks were not significantly different in the proportion who attended full time, however (table B).

Thirty-nine percent of both White and Black students were 25 years old and over. The majority of older students were undergraduates—61 percent of White students and 80 percent of Blacks. Among both Whites and Blacks, older undergraduates were more likely than young undergraduates to attend two-year colleges. Half of older White undergraduates attended two-year colleges compared with 29 percent of younger undergraduates. Among Blacks, the figures were 42 percent and 25 percent. Among Hispanics, half or nearly half of both older and young students attended two-year colleges in 1986.

[1] Controlled to 1980 census-based population estimates.
[2] Controlled to 1970 census-based population estimates.

Note: Figures for civilian population and persons enrolled in college may differ from previous reports because revised civilian figures were used for 1965 to 1975.

Appendix B. Definitions and Explanations

Population coverage. The figures in this report for October 1986 are sample survey data and related to the civilian noninstitutional population of the 50 States and the District of Columbia. The estimation procedure used for this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on civilian noninstitutional population counts from the decennial censuses and are updated with statistics on births, deaths, immigration, and emigration and statistics on the strength of the Armed Forces. Data published for 1972 through 1980 were based on independent population estimates derived by updating the 1970 decennial census counts. Starting with the data collected in the October 1981 Current Population Survey (CPS), independent estimates were based on civilian noninstitutional population controls for age, race, and sex established by the 1980 decennial census.

The April 1980 census population count differed somewhat from the independent estimates for April 1980 derived by updating 1970 census population figures. The April 1980 census count of the civilian noninstitutional population was 222,420,441, compared with the 1970 census based figure of 217,400,244 used for the CPS. Basically, this difference had little impact on summary or proportional measures, such as medians and percent distributions; however, use of the new controls could have significant effect on the absolute numbers.

School enrollment. The school enrollment statistics from the current survey are based on replies to the enumerator's inquiry as to whether the person was enrolled in school. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year in any type of graded public, parochial, or other private school in the regular school system. Such schools include nursery schools, kindergartens, elementary schools, high schools, colleges, universities, and professional schools. Attendance may be on either a full-time or part-time basis and during the day or night. Thus, regular schooling is that which may advance a person toward an elementary or high school diploma, or a college, university, or professional school degree. Children enrolled in nursery schools and kindergarten are included in the enrollment figures for regular schools, and are also shown separately.

Special schools are those which are not in the regular school system, such as trade schools or business colleges. Persons attending special schools are not included in the enrollment figures.

Persons enrolled in classes which do not require physical presence in school, such as correspondence courses or other courses of independent study, and in training courses given directly on the job, are also excluded from the count of those enrolled in school, unless such courses are being counted for credit at a regular school.

College enrollment. The college enrollment statistics are based on replies to the enumerator's inquiry as to whether the person was attending or enrolled in college. Enumerators were instructed to count as enrolled anyone who had been enrolled at any time during the current term or school year, except those who have left for the remainder of the term. Thus, regular college enrollment includes those persons attending a 4-year or 2-year college, university, or professional school (such as medical or law school) in courses that may advance the student toward a recognized college or university degree (e.g., BA or MA). Attendance may be either full time or part time, during the day or night.

Two-year and four-year colleges. Students enrolled in college were asked to report whether the college in which they were enrolled was a 2-year college (junior or community college) or a 4-year college or university. Students in the first 3 years were classified by the type of college they reported. Students in the fourth academic year of college or higher were assumed to be in a 4-year college or university.

School enrollment in year preceding current survey. An inquiry on enrollment in regular school or college in October of the preceding year was asked for persons 14 to 24 years old who were enrolled in college or not currently attending regular school.

Level of school. The statistics on level of school indicate the number of persons enrolled at each of five levels—nursery, kindergarten, elementary school (first to eighth grades), high school (ninth to twelfth grades), and college or professional school. The last group includes graduate students in colleges or universities. Persons enrolled in junior high school through the eighth grade are classified as in elementary school and the others as in high school.

Nursery school. A nursery school is defined as a group or class that is organized to provide educational experiences for children during the year or years preceding kindergarten. It includes instruction as an important and integral phase of its program of child care. Private homes in which essentially custodial care is provided are not considered nursery schools. Children attending nursery school are classified as attending during either part of the day or the full day. Part-day attendance refers to those who attend either in the morning or in the afternoon, but not both. Full-day attendance refers to those who attend in both the morning and the afternoon.

Head Start. Children enrolled in Head Start programs or similar programs sponsored by local agencies to provide preschool education to young children are counted under nursery or kindergarten as appropriate.

Public or private school. In this report, a public school is defined as any educational institution operated by publicly elected or appointed school officals and supported by public funds. Private schools include educational institutions established and operated by religious bodies, as well as those which are under other private control. In cases where enrollment was in a school or college which was both publicly and privately controlled or supported, enrollment was counted according to whether it was primarily public or private.

Full-time and part-time attendance. College students were classified, in this report, according to whether they were attending school on a full-time or part-time basis. A student was regarded as attending college full time if he/she was taking 12 or more hours of classes during the average school week, and part time if he/she was taking less than 12 hours of classes during the average school week.

Modal grade. Enrolled persons are classified according to their relative progress in school, that is, whether the grade or year in which they were enrolled was below, at, or above the modal (or typical) grade for persons of their age at the time of the survey. The modal grade is the year of school in which the largest proportion of students of a given age is enrolled.

Age. The age classification is based on the age of the person at his/her last birthday.

Race. The population is divided into three groups on the basis of race—White, Black, and other races. The last category includes American Indians, Japanese, Chinese, other Asian and Pacific Islanders, and any other race except White and Black. In this report, other races is not shown separately.

Hispanic origin. Information on origin or descent was obtained by asking, "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of birth of himself/herself or his/her parents.

Persons of Hispanic origin are persons who reported themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Hispanic origin. However, all persons who reported themselves as Mexican American, Chicano, Mexican, or Mexicano were combined into the one category—Mexican. Persons of Hispanic origin may be of any race.

Marital status. The marital status category shown in this report, "married, spouse present," includes persons who are currently married and living with their spouse.

The category "other marital status" includes persons who are single (never married), separated, divorced, or widowed.

Family. The term "family," as used here, refers to a group of two persons or more, related by blood, marriage, or adoption and residing together; all such persons are considered members of one family.

Primary family. A primary family is a family that includes among its members the persons or couple who maintains the household.

Family head. In the CPS, the term "head of family" was used to refer to the person maintaining the household. This practice was discontinued in surveys conducted after the 1980 Census of Population. However, in surveys taken prior to the 1980 Census of Population "family head" was used. In those surveys, husbands in husband-wife families were classified as "family heads." Women were only "family heads" if no spouse was present. The person who maintains the household is now called the "family householder."

Head versus householder. In the 1980 census, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" were used. Recent social changes resulted in greater sharing of household responsibilities among the adult members and, therefore, made the term "head" inappropriate in the analysis of household and family data. Specifically, the Bureau reconsidered its longtime practice of always classifying the husband as the head when he and his wife are living together.

In the 1980 census, the householder was the first adult household member listed on the census questionnaire. The instructions called for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife was listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members was recorded. The same procedure was followed in the CPS surveys conducted after the 1980 census. Therefore, the Bureau is publishing the responses on relationship as given in the CPS—the husband or wife could be the family householder.

Years of school completed. Data on years of school completed were derived from the combination of answers to two questions: (1) "What is the highest grade of school he/she has ever attended?" and (2) "Did he/she finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, and private, (including parochial) elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate, high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Family income. In this report, family income is derived from a single question asked of the household respondent when a household first enters the sample and is updated on the 1-year anniversary of entry. Income includes money income from jobs; net income from business, farm, or rent; pensions; dividends; interest; social security payments; and any other money income. The income of nonrelatives living in the household is excluded, but the income of all family members 14 years old and over, including those temporarily living away, is included. It should be noted that while characteristics of the person, such as age and marital status, and the composition of families refer to the date of the interview, family income statistics refer to receipts over a 12-month period starting 12 to 16 months prior to the interview.

The income tables include in the lowest income group those who were classified as having no income in the 12-month reference period and those reporting a loss in net income from farm and nonfarm self-employment or in rental income.

The detailed income tables include a separate category for families for which no income information was obtained. In most other CPR's showing income data, the missing income data have been allocated.

The money income level of families shown in this report may be somewhat understated. Income data from the October control card are based on the respondent's estimate of total family money income in broad, fixed income intervals. Income data collected in the March supplement to the CPS are based on responses to 11 direct questions asked about each person 14 years old and over and identifying 23 different sources of income in the preceding calendar year. Previous research has shown that the use of broad income intervals to record money income tends to reduce the rate of nonreporting, while increasing the likelihood that the amounts reported will be significantly understated as compared with results from more detailed questions.

Metropolitan-nonmetropolitan residence.

The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

Central cities. The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 30, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan areas as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

Comparability of metropolitan estimates. The new CPS metropolitan estimates have consistently been higher than independent estimates of the metropolitan population prepared by the Census Bureau; the new CPS nonmetropolitan estimates have been lower than the independent estimates. For example, between July 1985 and August 1986, the magnitude of the monthly differences varied from 900,000 to 2.5 million persons, so that the proportion of the population living in metropolitan areas according to the CPS has ranged from 0.4 to 1.0 percentage points higher than the independent estimate. The difference in level between the two sets of estimates is partially attributable to the basic CPS sample design, which, because of sampling variability, includes an oversample of metropolitan households and an undersample of nonmetropolitan households. The monthly variations result from the exit and entrance of rotation groups, each with slightly different metropolitan-nonmetropolitan proportions, into the sample. The apparent overestimation of metropolitan and underestimation of nonmetropolitan population in the CPS relative to the Bureau's independent estimates should be taken into account when using the data.

Geographic regions. The four major regions of the United States, for which data are presented, represent groups of States, as follows:

Northeast— Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest[1]— Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West— Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Symbols. The following symbols are used throughout the tables:

–	Represents zero or rounds to zero.
B	The base of the derived figure is less than 75,000.
(X)	Not applicable.
(NA)	Not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals which are independently rounded. With few exceptions, percentages are based on the rounded absolute numbers.

---

[1] Formerly North Central.

Appendix C. Source and Reliability of the Estimates

SOURCE OF DATA

Most of the estimates in this report are based on data obtained in October 1986 from the Current Population Survey (CPS) conducted by the Bureau of the Census and from supplementary questions to the CPS. Some estimates are based on data obtained from the CPS in earlier years. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member in every sample household. In addition, supplementary questions regarding school enrollment are asked about all eligible household members 3 years old and over each October.

The present CPS sample was initially selected from the 1980 census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. Each month, approximately 59,500 housing units are eligible for interview. Of this number, about 2,500 units are visited, but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

Description of the October Current Population Survey

Time period	Number of sample areas	Housing units eligible	
		Interviewed	Not interviewed
October 1985 to 1986.....	729	57,000	2,500
October 1984	[1]629/729	59,000	2,500
October 1981 to 1983.....	629	58,000	2,500
October 1980	629	63,000	3,000
October 1978 to 1979.....	614	53,500	2,500
October 1972 to 1977.....	461	45,000	2,000
October 1971	449	45,000	2,000
October 1967 to 1970.....	449	48,000	2,000
October 1965 to 1966.....	357	33,500	1,500
October 1960	333	33,500	1,500
October 1955	230	21,000	500-1,000
October 1947 to 1950.....	68	21,000	500-1,000

[1] The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from both designs were in the sample.

ESTIMATION

The estimation procedure used in this survey involves the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, sex, and Hispanic categories. These independent estimates are based on statistics from the decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. The independent population estimates used in this report to obtain data for 1981 and later are based on the 1980 decennial census. In earlier reports in this series (P-20), data for 1972 through 1980 were obtained using independent population estimates based on the 1970 decennial census. Estimates for earlier years were based on earlier censuses.

RELIABILITY OF THE ESTIMATES

Since the CPS estimates were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The accuracy of a survey result depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates. The standard errors provided for the CPS estimates primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure any systematic biases in the data. (Bias is the difference, averaged over all possible samples, between the sample estimates and the desired value.)

Nonsampling variability. Nonsampling errors can be attributed to many sources; e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of the respondents to provide correct information, inability to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage as compared to the level of the 1980 decennial census is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Sampling variability. The standard errors given in tables C-1 through C-4 are primarily measures of sampling variability, that is, of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Some statements in the report may contain estimates followed by a number in parentheses. For those statements one has only to add to and subtract from the estimate the number in parentheses to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (± 1.0)", the 90-percent confidence interval for the estimate, 1.7 percent, would be from 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the percent of adults who were high school graduates in 1986 to those in 1976. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance. This means that, for all the differences cited in the text, the estimated difference between characteristics is greater than 1.6 times the standard error of the difference.

Comparability of data. Caution should be used when comparing estimates for 1981 and later, which reflect 1980 census-based population controls, with estimates from earlier years. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of 1980-based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1981 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population, and these differences could be disproportionately greater for certain subpopulation groups than for the total population.

In addition, the estimates in this report for 1985 and 1986 are based on revised survey weighting procedures for persons of Hispanic origin. In previous years the estimation procedures used in this survey involved the inflation of weighted sample results to independent estimates of the noninstitutional population by age, sex, and race. There was, therefore, no specific control of the survey estimates for the Hispanic population. During the last several years, the Bureau of the Census has developed independent population controls for the Hispanic population by sex and detailed age groups and has adopted revised weighting procedures to incorporate these new controls. It should be noted that the independent population estimates include some, but not all, illegal immigrants.

Note when using small estimates. Summary measures (such as medians, and percent distributions) are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each data user's needs. Also, care must be taken in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables C-1 through C-4 are approximations to the standard errors of various school enrollment estimates for persons in the United States. To obtain the approximate standard error for a specific characteristic, the appropriate standard error in tables C-1 through C-4 must be multiplied by the factor for that characteristic given in table C-5. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of the sample design and the estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation.

The standard errors in tables C-1 through C-4 and the factors in table C-5 were calculated using the b parameters in table C-5. The parameters may be used directly to calculate the standard errors for estimated numbers and percentages. Methods for computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, S_x, of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$S_x = fs \qquad (1)$$

where f is the appropriate factor from table C-5 and s is the standard error of the estimate obtained by interpolation from table C-1 or C-2.

Alternatively, the standard error for estimates may be approximated by formula (2) from which the standard errors in tables C-1 and C-2 were calculated. Use of this formula will provide more accurate results than the use of formula (1) above.

$$S_x = \sqrt{-\frac{b}{T}x^2 + bx} \qquad (2)$$

Here x is the size of the estimate, T is the total number of persons in a specific age group and b is the parameter in table C-5 associated with the particular characteristic. If T is not known, for Total or White use 100,000,000; for Black or Hispanic use 10,000,000.

Illustration of the computation of the standard error of an estimated number. Table A-5 shows that in October 1986 there were 7,397,000 persons aged 18 to 24 years enrolled in college and 26,512,000 total persons in that age group. Using formula (1) with f = 1.0 from table C-5 and s = 110,300 from table C-1, the standard error of 7,397,000 is (1.0)(110,300) = 110,300. The value of s = 110,300 was obtained by linear interpolation in two directions in table C-1. The first interpolation was between 25,000,000 and 50,000,000 total persons for both 5,000,000 and 7,500,000 estimated persons yielding the values 96.6 and 110.9, respectively. The second interpolation was between these two values to get the value corresponding to 7,397,000 persons.

Alternatively, table C-5 indicates that the appropriate b parameter to use in calculating a standard error for this estimate is b = 2,312. Using formula (2), the approximate standard error is

$$111{,}000 \doteq \sqrt{\frac{2312}{26{,}512{,}000}(7{,}397{,}000)^2 + (2{,}312)\,(7{,}397{,}000)}$$

The 90-percent confidence interval is from 7,219,000 to 7,575,000 persons (using 1.6 times the standard error). Therefore, a conclusion that the average estimate from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table C-5 indicated by the numerator. The approximate standard error,

$S_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$S_{(x,p)} = fs \qquad (3)$$

In this formula, f is the appropriate factor from table C-5 and s is the standard error on the estimate from table C-3 or C-4. Alternatively, the standard error may be approximated by the following formula from which the standard errors in tables C-3 and C-4 were calculated. Use of this formula will give more accurate results than use of formula (3) above.

$$S_{(x,p)} = \sqrt{\frac{b}{x}(p)(100 - p)} \qquad (4)$$

Here x is the size of the subclass of persons or households which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$) is the parameter in table C-5 associated with the particular characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of an estimated percentage. Table A-5 shows that in October 1986 an estimated 34.0 percent of the 21,766,000 high school graduates aged 18 to 24 years were enrolled in college. Using formula (3) with f = 1.0 from table C-5 and s = 0.5 from table C-3, the standard error of 34.0 percent is (1.0)(0.5) = 0.5. Alternatively, using formula (4) with the appropriate b parameter of 2,312 from table C-5, the standard error of 34.0 percent is given by

$$0.5 \doteq \sqrt{\frac{2{,}312}{21{,}766{,}000}(34.0)(66.0)}$$

Thus, a 90-percent confidence interval for this estimate, using the standard error found by formula (4), is from 33.2 to 34.8 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$S_{(x-y)} = \sqrt{S_x^2 + S_y^2}$$

where S_x and S_y are the standard errors of the estimates x and y, respectively. The estimates can be numbers, percents, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the calculation of the standard error of a difference. Table A-5 of this report shows that in October 1986 an estimated 83.1 percent of 22,008,000 White persons 18 to 24 years old were high school graduates as compared to 76.4 percent of 3,665,000 Black persons of the same age group. Using formula (4), the approximate standard error of 83.1 percent is 0.4, and the approximate standard error of 76.4 percent is 1.1. The apparent difference between these two estimates is 6.7 percent, and the standard error associated with the difference is

$$1.2 \doteq \sqrt{(0.4)^2 + (1.1)^2}$$

The 90-percent confidence interval on the difference of 6.7 percent is from 4.8 to 8.6 percent. Therefore, a conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all samples. Since this interval does not contain zero, we can conclude with 90-percent confidence that the percentage of White persons aged 18 to 24 years who were high school graduates is different from the percentage of Black persons of the same age group.

Table C-1. Generalized Standard Errors for Estimated Numbers of Persons: Total or White

(Numbers in thousands)

Estimated number of persons	Total persons in age group									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000
10	4.6	4.7	4.8	4.8	4.8	4.8	4.8	4.8	4.8	4.8
20	6.1	6.5	6.7	6.7	6.8	6.8	6.8	6.8	6.8	6.8
30	7.0	7.8	8.1	8.2	8.3	8.3	8.3	8.3	8.3	8.3
40	7.4	8.8	9.2	9.4	9.5	9.6	9.6	9.6	9.6	9.6
50	7.6	9.6	10.2	10.5	10.6	10.7	10.7	10.7	10.7	10.7
75	6.6	11.0	12.1	12.7	13.0	13.1	13.1	13.1	13.2	13.2
100	-	11.8	13.6	14.4	14.9	15.1	15.1	15.2	15.2	15.2
200	-	9.6	16.7	19.2	20.6	21.1	21.3	21.4	21.5	21.5
300	-	-	16.7	22.0	24.7	25.5	25.9	26.2	26.3	26.3

75,000	-	-	-	-	-	-	-	-	-	208.2
100,000	-	-	-	-	-	-	-	-	-	-

Note: a. These standard errors must be multiplied by the appropriate factor in table C-5 to obtain the standard error for a specific characteristic.

b. To estimate standard errors for years 1956 to 1966 multiply the above standard errors by 1.14; for 1967 to 1980, multiply by 0.93.

c. The standard errors were calculated using the formula $\sqrt{-(b/T)\,x^2 + bx}$, where b = 2,312 (from table C-5) and T is the total number of persons in an age group.

- Not applicable.

Table C-2. Generalized Standard Errors for Estimated Numbers of Persons: Black and Hispanic

(Numbers in thousands)

Estimated number of persons	Total persons in age group						
	100	250	500	1,000	2,500	5,000	10,000
10	4.8	5.0	5.0	5.1	5.1	5.1	5.1
20	6.4	6.9	7.1	7.1	7.2	7.2	7.2
30	7.4	8.3	8.6	8.7	8.8	8.8	8.8
40	7.9	9.3	9.8	10.0	10.1	10.2	10.2
50	8.1	10.2	10.8	11.1	11.3	11.3	11.4
75	7.0	11.7	12.9	13.4	13.8	13.9	13.9
100	-	12.5	14.4	15.3	15.8	16.0	16.0
200	-	10.2	17.7	20.4	21.9	22.3	22.6
300	-	-	17.7	23.4	26.2	27.1	27.5
400	-	-	14.4	25.0	29.6	30.9	31.6
500	-	-	-	25.5	32.2	34.2	35.1
750	-	-	-	22.1	36.9	40.7	42.5
1,000	-	-	-	-	39.5	45.6	48.4
2,000	-	-	-	-	32.2	55.9	64.5
3,000	-	-	-	-	-	55.9	73.9
4,000	-	-	-	-	-	45.6	79.0
5,000	-	-	-	-	-	-	80.6
7,500	-	-	-	-	-	-	69.8
10,000	-	-	-	-	-	-	-

Note:
a. These standard errors must be multiplied by the appropriate factor in table C-5 to obtain the standard error for a specific characteristic.
b. To estimate standard errors for years 1956 to 1966 multiply the above standard errors by 1.14; for 1967 to 1980, multiply by 0.93.
c. The standard errors were calculated using the formula, $\sqrt{-(b/T)\,x^2 + bx}$, where b = 2,600 (from table C-5) and T is the total number of persons in an age group.

- Not applicable.

Table C-3. Generalized Standard Errors for Estimated Percentages: Total or White

Base of percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
100	2.1	3.3	4.6	6.6	7.6
250	1.3	2.1	2.9	4.2	4.8
500	1.0	1.5	2.0	2.9	3.4
1,000	0.7	1.0	1.4	2.1	2.4
2,500	0.4	0.7	0.9	1.3	1.5
5,000	0.3	0.5	0.6	0.9	1.1
10,000	0.2	0.3	0.5	0.7	0.8
25,000	0.13	0.2	0.3	0.4	0.5
50,000	0.09	0.15	0.2	0.3	0.3
100,000	0.07	0.10	0.14	0.2	0.2
150,000	0.05	0.09	0.11	0.2	0.2

Note:
a. These values must be multiplied by the appropriate factor in table C-5 to obtain the standard error for a specific characteristic.
b. To estimate standard errors for years 1956 to 1966 multiply the above standard errors by 1.14; for 1967 to 1980, multiply by 0.93.
c. The standard errors were calculated using the formula, $\sqrt{(b/x)\,p\,(100-p)}$, where b = 2,312 from table C-5.

Table C-4. Generalized Standard Errors for Estimated Percentages: Black and Hispanic

Base of percentage (thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.6	4.1	5.6	8.1	9.3
100	2.3	3.5	4.8	7.0	8.1
250	1.4	2.2	3.1	4.4	5.1
500	1.0	1.6	2.2	3.1	3.6
1,000	0.7	1.1	1.5	2.2	2.5
2,500	0.5	0.7	1.0	1.4	1.6
5,000	0.3	0.5	0.7	1.0	1.1
10,000	0.2	0.4	0.5	0.7	0.8
15,000	0.2	0.3	0.4	0.6	0.7
20,000	0.2	0.2	0.3	0.5	0.6

Note: a. These standard errors must be multiplied by the appropriate factors in table C-5 to obtain the standard error for a specific characteristic.
b. To estimate standard errors for years 1956 to 1966 multiply the above standard errors by 1.14; for 1967 to 1980, multiply by 0.93.
c. The standard errors were calculated using the formula, $\sqrt{(b/x)\, p\, (100-p)}$, where b = 2,600 from table C-5.

Table C-5. Parameters and Factors to be Used for School Enrollment Characteristics for Direct Computation of Standard Errors

(Use for 1981 and later years)

Characteristic	b parameters	f factor
Persons enrolled in school		
3 to 34 years old:		
Total or White	2,312	1.0
Black	2,600	1.0
Hispanic origin	2,600	1.0
14 to 34 years old:		
Total or White	2,312	1.0
Black	2,600	1.0
Hispanic origin	2,600	1.0
Children enrolled in school		
3 to 13 years old:		
Total or White	2,698	1.1
Black	2,698	1.0
Hispanic origin	2,698	1.0

Note: a. For nonmetropolitan data cross-tabulated with other data, multiply f by 1.2 and the b parameter by 1.5.
b. Multiply the b parameter by 0.87 for CPS data collected from 1967 to 1980 and by 1.3 for CPS data collected from 1956 to 1966.
c. For regional data, multiply the b parameter by 0.88 for the Northeast, 0.91 for the Midwest, 0.89 for the South, and 0.81 for the West.
